A 1910 physics book asks: "When a tree falls in a lonely forest, and no animal is near by to hear it, does it make a sound? Why?" [Charles Riborg Mann, George Ransom Twiss, "Physics" (1910), p. 235.] The phrase is occasionally the source of parody such as 's "If a man speaks in the forest and there is no woman there to hear it, is he still wrong?" or 's "If a tree falls in a forest, and we've already sold the tree, does it still have quality?" Interpretations. The possibility of unperceived existence. Can something exist without being perc

Random Forest is a computationally efficient technique that can operate quickly over large datasets. It has been used in many recent research projects and real-world applications in diverse domains. However, the associated literature provides almost no directions about how many trees should be used to compose a Random Forest.Â In addition, it was found an experimental relationship for the AUC gain when doubling the number of trees in any forest. Furthermore, as the number of trees grows, the full set of attributes tend to be used within a Random Forest, which may not be interesting in the biomedical domain.
