The Ocular Examination: Measurements and Findings - AbeBooks Additionally, 3 of the 17 birds were anesthetized for bilateral B-mode ocular ultrasonography examination to obtain axial globe measurements. Results showed

Direct medical costs include ocular hypotensive drugs, physician, and hospital visits, as well as glaucoma-related procedures. Indirect costs reflect lost productivity, such as days missed from work, and include loss of productivity of caregivers. Individuals with late-stage disease incur significant additional indirect costs and constitute a substantial burden on healthcare resources. Findings may include evidence of previous surgery that the patient has forgotten, thus adding a possible game-changing factor to a treatment plan. Measurement of IOP before dilation is an essential part of the initial examination and must be performed with assurance that breath-holding is prevented. IOP is determined by the balance of aqueous humour production and drainage. Based on Results from the Ocular Hypertension Treatment Study (OHTS) and the European Glaucoma Prevention Study (EGPS), we present a method for estimating the 5-year risk that an individual with ocular hypertension will develop Primary Open Angle Glaucoma (POAG). The method may be useful to clinicians and patients in deciding the frequency of tests and examinations and the potential benefit of starting treatment. More information is available in the manuscript, "Validated Prediction Model for the Development of Primary Open Angle Glaucoma in Individuals with Ocular Hypertension," published i
